The aim of the study was to explore an effective method to induce adipose-derived stem cells (ADSCs) to differentiate into Schwann-like cells in vitro.

Material and methods. Reagents were applied in two different ways (Dezawa inducing method and modified inducing method) in which inducers including β -mercaptoethanol (β -ME), all-trans-retinoic acid (ATRA), type I collagenase, forskolin, heregulin, basic fibroblast growth factor (BFGF) and brain-derived neurotrophic factor (BDNF) were

Fresh whole adipose tissue was utilized within 24 hours of harvest, and stem cells were isolated from approximately 15 g of tissue employing a standard collagenase protocol. 10, 21-24 Pre- and sub-Scarpa's fascia adipose were combined to mitigate any variability within each patient because the sample harvest protocol made it difficult to distinguish adipose origin.

Adipose-derived stem cells (ASCs) are multipotent mesenchymal stromal cells with tri-lineage differentiation potential, ability of self-migration to injured tissue, fewer ethical controversies, and lower risk of rejection [1,2]. The critical element in the regenerative properties of fat grafting depends on ASC richness.
